

AMENDMENTS TO THE CLAIMS

---

1. (Currently Amended) A fault handling system which detects a fault in an information processing system, and performs fault handling processing corresponding to a the detected fault in the information processing system, the fault handling system comprising:

a fault management table for storing operation mode information indicating an operating ~~status~~ mode of the information processing system and a type of the fault handling processing corresponding to the detected fault in the information processing system, the operation mode information being related with the type of the fault handling processing; and

a fault handling facility for determining the operation mode information and for obtaining the type of the fault handling processing corresponding to the operation mode information determined from the fault management table.

2. (Original) The fault handling system of claim 1, further comprising a fault detecting section for detecting a fault in the information processing system, for determining fault class information indicating a degree of seriousness of the fault

detected and for outputting the fault class information determined to the fault handling facility;

AB wherein the fault management table stores the fault class information and the type of the fault handling processing, the operation mode information being related with the type of the fault handling processing, and

wherein the fault handling facility inputs the fault class information from the fault detecting section and obtains the type of the fault handling processing corresponding to the fault class information inputted from the fault management table.

3. (Currently Amended) The fault handling system of claim 1, further comprising:

a fault handling section including a module for providing the fault handling processing;

wherein the fault handling facility notifies the fault handling section of the type of the fault handling processing obtained, and

wherein the fault handling section starts the module for providing the type of the fault handling processing notified.

4. (Original) The fault handling system of claim 1, wherein the type of the fault handling processing includes a type of fault information recording processing for recording the fault detected, and

wherein the fault management table includes a fault information recording management table for storing the operation mode and the type of fault information recording processing, the operation mode information being related with the type of fault information recording processing.

5. (Original) The fault handling system of claim 1, wherein the type of the fault handling processing includes a type of the fault recovery processing, and

wherein the fault management table includes a fault recovery management table for storing the operation mode and the type of fault recovery processing, the operation mode information being related with the type of fault recovery processing.

6. (Original) The fault handling system of claim 1, further comprising an operating status input section for inputting the operating status of the information processing system;

13 wherein the fault handling facility inputs the operating status being inputted from the operating status input section and determines the operation mode information according to the operating status inputted.

7. (Original) The fault handling system of claim 1, further comprising an attached device management facility for detecting an attached device connected with the information processing system;

wherein the fault handling facility determines the operation mode information based on the attached device detected by the attached device management facility.

8. (Original) The fault handling system of claim 7, wherein the operation mode information includes operation mode information indicating the operating status of the information processing system depending on a type of the attached device connected with the information processing system;

wherein the type of the fault handling processing includes the type of the fault handling processing depending on the type of the attached device connected with the information processing system, and

13 wherein the fault management table stores the type of the fault handling processing and the operation mode information, the operation mode information being related with the type of the fault handling processing according to the type of the attached device connected with the information processing system.

9. (Original) The fault handling system of claim 1, further comprising a system configuration management facility for examining a system configuration of the information processing system to define a type of system configuration and for notifying the fault handling facility of the type of system configuration defined;

wherein the fault handling facility determines the operation mode information based on the type of system configuration notified by the system configuration management facility.

10. (Original) The fault handling system of claim 9, wherein the operation mode information includes operation mode information indicating the operating status of the information processing system depending on the type of system configuration;

wherein the type of the fault handling processing includes the type of the fault handling processing corresponding to the type of system configuration, and

AM wherein the fault management table stores the type of the fault handling processing and the operation mode information, the type of the fault handling processing being related with the operation mode information based on the type of system configuration.

11. (Original) The fault handling system of claim 9, wherein the type of system configuration includes one of an installing system configuration and an updating system configuration.

12. (Original) The fault handling system of claim 9, wherein the type of system configuration includes one of a duplex system configuration and a single system configuration.

13. (Original) The fault handling system of claim 12, wherein the system configuration management facility monitors the operating status of the information processing system in a duplex system, and switches the operation mode to a single system operation in a case that another system in the duplex system is not in execution.

14. (Original) The fault handling system of claim 2, wherein the fault handling facility determines the operation mode information

based on the fault detected in the information processing system by the fault detecting section.

13  
15. (Currently Amended) The fault handling system of claim 14, wherein the fault handling facility detects that the information processing system has ~~been~~ recovered from the fault detected and determines the operation mode based on a detected result.

16. (Currently Amended) A fault handling method, comprising;  
defining operation mode information indicating an operating ~~status~~ mode of an information processing system, and a type of fault handling processing corresponding to a fault in the information processing system;

storing the operation mode information and the type of fault handling processing defined, the operation mode information being related with the type of fault handling processing;

detecting a fault in the information processing system;

obtaining an operation mode of the information processing system when the fault is detected,

~~obtaining~~ determining the type of fault handling processing corresponding to the operation mode information obtained; and

13 handling the fault detected by using the determined type of fault handling processing obtained.

17. (New) A method of handling a fault that has been detected in an information handling system that is operating in one of a plurality of operating modes, comprising:

classifying the detected fault in the information handling system into one of a plurality of fault types;

determining the operating mode of the information handling system;

determining a fault handling process from among a plurality of fault handling processes based on the determined fault type and the determined operating mode of the information handling system; and

executing the determined fault handling process to handle the fault.

18. (New) The method of handling a fault according to claim 17,

wherein the operating mode includes a development operating mode, a test verification mode, a maintenance mode, and a substantial operation mode.

19. (New) The method of handling a fault according to claim 17,  
wherein the operating mode is dependent upon a connection  
status of a peripheral device to which the information handling  
system is operatively connected.

20. (New) The method of handling a fault according to claim 17,  
wherein the information handling system is a first  
information handling system operatively connected to a second  
information handling system in a duplex system configuration,  
wherein the operating mode is dependent upon a status of  
the second information handling system.

21. (New) The method of handling a fault according to claim 20,  
wherein the status of the second information handling  
system is a connection status with the first information handling  
system.

22. (New) The method of handling a fault according to claim 17,  
wherein the operating mode is dependent upon whether a  
software module of the information handling system has been  
recently updated.

23. (New) The method of handling a fault according to claim 17,  
wherein the fault handling processes include processes for  
outputting fault information and processes for correcting the  
fault.

24. (New) The method of handling a fault according to claim 17,  
further comprising:

classifying the detected fault type into one of a plurality  
of fault classes indicating various degrees of fault seriousness,

said determining step determining the fault handling  
process from among a plurality of fault handling processes based  
on the determined fault type, the fault class and the determined  
operating mode of the information handling system.
